Patent No. 6340740

GENERAL INFORMATION:
APPLICANT, Fernandez-Alnemri, Teresa
TITLE OF INVENTION: CASPASE-14, AN APOTOTIC PROTEASE, NUCLEIC ACID ENCODING
TITLE OF INVENTION: AND METHODS OF USE
FILE REFERENCE: 480140.434C1
CURRENT APPLICATION NUMBER: US/09/187,789
CURRENT FILING DATE: 1998-11-06
NUMBER OF SEQ ID NOS: 78
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 15
LENGTH: 89
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

(first entry)

The sequences given in AAR30472-73 represent fragments of intercellular adhesion molecule-3 (ICAM-3). Comparisons of these sequences with known sequences from ICAM-1 and ICAM-2 reveals a high degree of homology between NK-17 and sequences shown in the first Ig domain of ICAM-2. NK-10 peptide shows weak homology to sequences within domain of ICAM-1. These peptide sequences were used to design probes for the isolation of the cDNA encoding ICAM-3 (see also AA033110-11). ICAM-3 is involved in the process by which populations of leukocytes recognise and adhere to cellular substrates. ICAM-3 mediates cellular interactions with other lymphocytes, macrophages and neutrophils at the site of inflammation and sites of immune responses. Disclosure; Page 75; 123pp; English.                                                                                                                                                                                                                                                                            ö
                                      AAR83061-R83085, AAR83090-R83096 and AAR92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                            Gaps

This invention relates to a new human antibody specific for human interleukin-12 (IL-12). The invention also includes antigen binding portions that bind to IL-12. Sequences AAB3945-B39516 represent human carti-IL-12 antibody heavy and light chain complementarity determining region (CDR) amino acid sequences, and also includes variable region amino acid sequences are given in AAB39517-B39560 and AAB40068-B40149. Sequences AAB3977-B40063 represent anti-IL-12 CDR3 related amino acid sequences are given in AAB40064-B40067-B40063-B40149. Sequences AAB3977-B40063 represent other CDR sequences. Light chain CDR3 consensus sequences are given in AAB40064-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067-B40067
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human antibody specific for human interleukin-12 (IL-12) used to treat disorders characterized by aberrant IL-12 expression e.g. Crohn's

AAW36170-72 are mouse ATM protein epitopes used to generate polyclonal antibodies. Antibodies raised against the ATM protein detected mono-specifically a high molecular weight of the expected size of 350 kDa on Western blots of protein lysates derived from fibroblast and lympho- blastoid cell lines. Because of the high frequency of truncation mutations in the ATM gene, mutated ATM protein can be identified if such proteins are stable. Mutations in the ATM gene cause ataxiatelangiectasia (A-T), a progressive genetic disorder affecting the central nervous and immune systems. The ATM gene, located at chromosome that links DNA damage surveillance to cell cycle control. The ATM gene product (AAW07655) has a highly conserved C-terminal region showing high sequence homology to the catalytic domain of phosphatidylinositol-3
                                                                     Ataxia-telangiectasia, A-T; mutated, ATM; 11q22-23; signal transduction; DMA damage; cell cycle control; screening; gene therapy; catalytic; phosphatidylinositol-3 kinase; PI-3; cancer predisposition; carrier; untranslated region; UTR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    kinases. A-T mutations affect a variety of tissues and lead to cancer predisposition. Identification of A-T carriers, by analysis at nucleic acid or protein levels, allows better supervision and treatment of such subjects who are at increased risk of developing cancer and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New gene ATM implicated in ataxia-telangiectasia and related protein - useful in screening methods, partic. for identifying disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly sensitive to radiation. The transgenic animals and transformed cells are useful as models of the human disease. Also vectors expressing the ATM protein can be used in gene therapy of

                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibodies which are specific for a haemostatic protein and can substantially distinguish between intact and cleaved species of the haemostatic protein. The pypeptide corresponds to amino acid residues 320-335 of factor IX. Haemostatic proteins are used in the treatment of haemostatic e.g. thromboembolic diseases. See
                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide; peptide; oligopeptide; factor IX; haemostatic prote;

viral A-T.

```
AAW07656-62 are human ATM protein epitopes used to generate polyclonal and monoclonal antibodies. Antibodies raised against the ATM protein detected monoclonal antibodies. Antibodies raised against the ATM protein and monoclonal antibodies of 1350 kDa on Western blots of protein legate derived from fibroblast of 350 kDa on Western blots of protein are stable. Mutations in the ATM gene, can be central nervous and immune systems. The ATM gene, located at the ATM gene cause ataxia telangiectasia (A-T), a progressive genetic disorder affecting the central nervous and immune systems. The ATM gene, located at chromosome 11g22-23, is probably involved in a novel signal transduction system that links DNA damage surveillance to cell cycle control. The ATM gene product (AAW07655) has a highly conserved C-terminal region showing high sequence homology to the catalytic domain of phosphatidylinositol. Kinases. A-T mutations affect a variety of tissues and lead to cancer predisposition. Identification of A-T carriers, by analysis at nucleic solid or protein levels, allows better supervision and treatment of such subjects who are at increased risk of developing cancer and are transformed cells are useful as models of the human disease. Also viral vectors expressing the ATM protein can be used in gene therapy of A-T.
                                                                                                                                                                                          New gene ATM implicated in ataxia-telangiectasia and related protein - useful in screening methods, partic. for identifying disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; breast cancer; breast cancer associated protein isoform; BPI; breast cancer associated feature; BF; diagnosis; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a peptide derived from M-ras protein, which was used to raise antibodies. M-Ras, a part of the interleukin-9 signaling pathway. is involved in pathogenesis of atopic allergy, asthma and similar conditions, some leukemias and lymphomas and tumors. Agents that downregulate M-Ras are used to treat these conditions, particularly T-cell lymphoma or leukemia; Hodgkin's disease and mycosis fungoides. Measuring levels of M-Ras being indicative of disease).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA damage; cell cycle control; screening; gene therapy; catalytic; phosphatidylinositol-3 kinase; PI-3; cancer predisposition; carrier;

Cis-element; ligand; highly specific DNA binding domain; HSDB; human; H2-kappa B; regulatory domain; murine; homologue; LL-6; interleukin; HLA class I gene; HLA-B27; HLA-A2; acute phase protein response; syngene; immune response; LL-8; LL-16; diagnosis; gene therapy;
                                                                                                                                                                                                                                        New chimaeric peptide(s) including a conformational epitope -
inserted into a peptide having similar native conformation, useful
in vaccines and for determn. of minimal epitope(s) or for mapping
amphipathic helices
                                                                                                                                                                                                                                                                                                                                                                                            The present peptide is a chimaeric peptide (CP), contg. a C. elegans unc-15 paramyosin peptide. The CP comprises a B-cell conformational epitope from within unc-15, inserted into a 2nd peptide, pref. an alpha-helical coil based on the GCN4 leucine zipper peptide (AAR97395). The 2nd peptide has a similar conformation, enabling the epitope to be presented in an immunologically active conformation, mapping process, e.g. to determine the min. epitope required to induce opsonic antibodies (AAb), and in vaccines against C. elegans. Ab raised against the Can be used for immunotherapy and diagnosis, while the CP can be used diagnostically to detect Ab.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 20; DB 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                             The present invention describes a method for the screening, diagnosis or prognosis of breast cancer (BC), determining the stage or severity of BC, and monitoring the effect of therapy administered to a subject having BC, comprising analysing a sample of body fluid by two dimensional comprising a chosen feature whose abundance correlates with BC or predicts the onset or course of BC. The method (I) involves:

(a) analysing a sample of body fluid from the subject by two-dimensional clectrophoresis to generate a two-dimensional array of features, comprising a chosen feature whose relative abundance correlates with BC or predicts the onset of BC; and (b) comparing the abundance of each or predicts the onset of BC; and (b) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in the body fluid from one or more persons free from BC, or with a previously determined reference range for that feature in subjects free from BC, or with the abundance of an expression reference (BBF)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in the test sample. The method is useful for screening, diagnosis or prognosis of breast cancer, determining the stage or severity of BC, and for identifying a subject at risk of developing BC, AAB87140 represents breast cancer associated protein isoform (BPI) peptide sequences, and AAF91643 to AAF91848 represent BPI probes used in
                                                                                     Screening, diagnosis or prognosis of breast cancer, by analyzing a sample of serum or plasma by two dimensional electrophoresis to detect the presence or level of a breast cancer-associated feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAH12943 to AAH17195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the profeins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps,
                                                                                                                          The sequences given in AAR91378-414 represent peptides that bind to highly specific DNA binding domains (HSDB)'s. These sequences were tested for binding to the H2-kappa-B oligonucleotide which contains the NF-kappa-B binding site, and comprises the sequence given in AAT1579. These peptides may be used in a composition for diagnosis and gene therapy and for modifying the transcription or activity of a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers -
                                                                                                                                                                                                                                                                                                          Gaps
                            Synthetic random nucleotide sequences encoding ligand binding domains - identified by screening library of vectors or peptide(s) and useful for gene therapy and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                colon cancer; colon cancer antigen; diagnosis; detection;

by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and ABB77789 represent sequences used in the exemplification of the present invention.

N. B. Pages 66 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; mutant; mutain; oestrogen receptor-alpha; zinc finger; oestrogen receptor-beta; vitamin D receptor; retinoic acid receptor; thyroid hormone receptor; proliferation; motility; invasiveness; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to treat or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a pharmaceutical composition containing at least a nucleic acid encoding a variant oestrogen receptor that comprises part of the receptor's C region (containing the first zinc finger) but which lacks the ability to bind cestrogen and/or AF-2 (a transcriptional activator). The variation is especially in the region comprising amino acid 179-215 of the alpha cestrogen receptor. Similar variations may be generated in the homologous of other cestrogen-type receptor such as cestrogen receptor-beta, vitamin D receptor, retinoic acid receptor or thyroid hormone receptor (see peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition containing nucleic acid encoding variant estrogen receptor reduces proliferation, motility and invasiveness of cancer cells, useful for treating or preventing cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 motility

AAY64651 to
AAY65438 represent the BST-related proteins corresponding to AAZ42265 to
AAZ43052. The ST. ESTS can be used for producing secreted human gene
products. They can be used for producing secreted human gene
products. They can be used for producing secreted human gene
control the stage. They can be used in solate 5' untranslated
costion, development stage, rate, and quantity of protein synthesis, as
well as stability of mRNA. The ESTs are also useful as probes for
chromosome mapping, and to obtain full length cDNA clones. The ESTs can
also be used in forensic procedures to identify individuals, or in
diagnostic procedures to identify individuals having genetic diseases
resulting from abnormal gene expression. The products may also be used in
diagnostic protecting extracellular secretion of a polypeptide or the
used for directing extracellular secretion of a polypeptide or the
cinca cell. The proteins encoded by the EST sequences may be useful in
treating a variety of human conditions. Secreted proteins have
therapeutic value, and the identification of new secreted proteins is
therapeutic value, and the identification of new secreted proteins is

AMK54951 to AAK64702 encode the human immune/haematopoietic antigen (1)
amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic
activity, and can be used in gene therapy and vaccine production. (1)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (1) expression. For
example, they may be used to treat disorders associated with decreased
cxpression by rectifying mutations or deletions in a patient s genome
that affect the activity of (1) by expressing inactive proteins or to
supplement the patients own production of (1). Additionally, (1)
cupplement display and culturing the cell to express the
protein. (1) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK64942 to AAK64950 and AAM82169
represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 11; SEQ ID NO 15450; 3071pp + Sequence Listing; English.

BIOCHOMISTY 37:9612-9618[1998].

-1- FUNCTION: CATALYZES THE TRANSFER OF A FARNESYL MOIETY FROM FARNESYL PYROPHOSPHATE TO A CYSTEINE AT THE FOURTH POSITION FROM THE C-TERMINUS OF SEVERAL PROTEINS. THE ALPHA SUBUNIT IS THOUGHT TO PARTICIPANTE IN A STABLE COMPLEX WITH THE SUBSTRATE FARNESYL-PP. THE BETA SUBUNIT BINDS THE PEPTIDE SUBSTRATE.
-1- SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA SUBUNIT.
-1- SIMILARITY: BELONGS TO THE PROTEIN PRENYLTRANSFERASE ALPHA SUBUNIT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

A;Title: Cloning and expression of a cDNA encoding the alpha subunit of rat p21(ras) properties of a cDNA encoding the alpha subunit of rat p21(ras) properties of a cDNA encoding the alpha subunit of rat p21(ras) properties of a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rat p21(ras) properties and a cDNA encoding the alpha subunit of rational content and a cDNA encoding the alpha subunit of rational content and a cDNA encoding the alpha subunit of rational content and a cDNA encoding the alpha subunit of rational content and a cDNA encoding the alpha subunit of rational content and a cDNA encoding the alpha encoding the content and a cDNA encoding the alpha encoding the content and a cDNA encoding the cD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Molecule type: mRNA
A;Residues: 1-340 <KOH>
A;Cresidues: 1-340 <KOH>
A;Cresidues: Citis sequence was confirmed by protein sequencing
C;Comment: This protein attaches farnesyl residues to a cysteine near the carboxyl term
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the farn∉
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A,Molecule type: mRNA
A,Residues: 1-377 <SH1>
A,Experimental Bource: 1071/2 cell line
C,Comment: This enzyme, which contains two subunits, alpha and beta, transfers the farn g nuclear lamins and retinal proteins. This enzyme is a heterodimeric enzyme and alpha C,Genetics:

  The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease as secciated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent of or use in treatment of a pathology related to abstrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, testing and to can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FT comprises two subunits each having a mol. wt. of 45-50 kD (SDS-PAGE). The tryptic digests of the alpha unit are represented in AAR14712-17, and of the beta unit in AAR14718-2 sound of the beta unit in AAR14718-2 sound of the beta unit in against seat of solate inhibitors. Such inhibitors can be used to block the attachment of farnesyl gps. to rasportants in malignant cells of patients suffering with cancer or pre-cancerous states to treat or palliate the cancer. See also AAR14711-23, AAR15751-81 and AAQ14541-47.

The cDNA may be used to produce recombinant FT, useful for screening potential anticancer agents that prevent expression of p21ras.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             derived from rat brain tissue. The enzyme was used in a method for identifying FT inhibitors. The method involved screening candidate compounds for the ability to inhibit the transfer of a farnesyl moiety of A K-ras B protein. FT inhibitors act by blocking the attachment of prenyl groups to ras proteins in malignant cells of patients suffering from cancer or precancerous states, and as such are used to treat such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW04427 shows the alpha subunit of a farnesyl transferase (FT) enzyme
                                                      AAR77839 is the alpha subunit of rat farnesyl transferase which is involved in the farnesylation of various cellular proteins including the cancer related ras proteins. It is used to produce the complete farnesyl transferase molecule which is used to demonstrate the effectiveness of peptide inhibitors capable of inhibiting farnesyl transferases. The peptide inhibitors are useful for treating cancers and ras-related cancers in particular.
                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Farnesyl transferase; inhibitor; cancer; tumour; neoplasia; prenyl; ras protein; K-ras B; malignant; detection; identification.

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB193202 to AB193912, encoding the protein sequences in ABB57020 to ABB57031) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gape
                                                                                                                           Mouse ischaemic condition related protein sequence SEQ ID NO:375.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

It is used to produce the complete farnesyl transferase molecule which is used to demonstrate the effectiveness of peptide inhibitors capable of inhibiting farnesyl transferases. The peptide inhibitors are useful for
                                                                                                                                                                         The cDNA encoding the human alpha subunit of PPTase was isolated from a human placental cDNA library in lambda gt11 using a bovine PPTase cDNA probe. The FPTase can be used to assess the inhibitory activity of a cpd. in the farmesylation of a protein substrate. The assay can be used to identify anticancer agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The cDNA (AAQ44395) and amino acid (AAR49734) sequences of human farnesyltransferase (FT) alpha-subunit were determined. The cDNA may be used to produce recombinant FT, useful for screening potential anticancer agents that prevent expression of p21ras.
                                                                                                                                                                                                                                                                                                                                                                                                                               New farnesyl-transferase inhibitors - used for inhibiting attachment of a farnesyl moiety to a p21ras protein in malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The enzyme was used in a method for identifying FT inhibitors. The method involved screening candidate compounds for the ability to inhibit the transfer of a farnesyl moiety to a K-ras B protein. FT inhibitors act by blocking the attachment of prenzy groups to ras proteins in malignant cells of patients suffering from cancer or precancerous states, and as such are used to treat such conditions.
